

What is the best way to determine if a Transfer Object is populated or is new object?

What is the best way to determine if a Transfer Object is populated or is new object?

`getIsPersisted()` tells you if the object came from, or has been stored (persisted) in the database.

`getIsDirty()` tells you if the object has changed since it was last committed, OR if it was never committed in the first place.

- A new object - persisted: false, dirty: true
- A saved object - persisted: true, dirty: false
- A saved object that has been modified, but not re-saved - persisted: true, dirty: true
- A get'd object - persisted: true, dirty: false.

Generally, you only ever need check `getIsPersisted()`. More details can be seen at [Generated Methods](#).
