

I keep getting database errors with repeated field names in the select list

When you set up a *OneToMany* or *ManyToOne* composition relationship, don't include the foreign key field in the list of properties for either the parent or the child table.

For example, this would be **bad** configuration:

```
<object name="Order">
  <id name="id" type="numeric" />
  <property name="fkiduser" type="numeric" />
  <onetomany name="User">
    <link column="fkiduser" to="user.User" />
  </onetomany>
</object>
```

As you can see the *fkiduser* foreign key is used twice, which is not what you want.

This would be correct:

```
<object name="Order">
  <id name="id" type="numeric" />
  <onetomany name="User">
    <link column="fkiduser" to="user.User" />
  </onetomany>
</object>
```
